Bento Soares, Univeristy of Iow CDNA Library Arrayed by: Dr. M. Bento Soares, Univeristy of Iowa DNA Sequencing by: Dr. M. Bento Soares, Univeristy of Iowa Cone Distribution: Researchers may obtain clones from Research
constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an ECOR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the

(1995), Genome Research 6(9): 791-806. RNA was prepared from harvested cells of SNU-16 culture. SNU-16 cell was obtained from Korean Cell Line Bank (KCLB). SNU-16 was established from ascitic fluids of Korean patients by Park J.G. et al. (1990), Cancer Res 50: 2773-2780."

	1.839				• .					

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                          CC The invention relates to immunostimulatory fusion proteins (IFP) and CC nucleic acid molecules encoding such proteins. The IFPs comprise a CC polypeptide antigen component and an immunostimulatory component derived CC from the intracellular domain of HER-2 protein which is effective to CC elicit a protective dendritic cell (DC) induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells CC are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer CC associated with a particularly antigen. The present sequence is HER500 hGM-CSF fusion DNA construct which comprises DNA molecules encoding CC human PAP signal sequence, mature PAP protein, an Ala Arg linker, human CC HER-2 signal sequence, mature HER-2 membrane distal, extracellular and CC intracellular domains, an Ala Ala linker, a mature human granulocyte- macrophage colony stimulating factor (GM-CSF) sequence and a CC c-terminal tag.

                                                            are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 rGM-CSF fusion DNA construct which comprises DNA molecules encoding human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 signal sequence, mature HER membrane distal extracellular domain, an Ala linker, an ovalbumin (OVA)-derived immunodominant octapeptide, HER-2 membrane distal intracellular domain, an Ala Ala linker, a mature.
                                                                                                                                                                        The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells
Sequence
                                                                                                                                                                                                                                                                                                                   An immunostimulatory fusion protein comprising the intracellular domain of HER-2 and an antigen elicits an immune response to the antigen and is useful for the treatment of associated cancer associated -
                                                                                                                                                                                                                                                                                                                                                                                                      WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30-MAR-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ovalbumin-derived octapeptide;

IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HER500 fusion DNA construct which comprises DNA molecules encoding human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 membrane distal extracellular and intracellular domains and a communication of the color of the
                                                                                                                                                                                                                                                                                                                                                                                nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HBR-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or emporantimental 3-13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of

The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is HEB500 fusion DNA construct which comprises DNA molecules encoding human PAP signal sequence, mature PAP protein, an Ala Arg linker, human HER-2 membrane distal extracellular domain, an Ala linker, an ovalbumin (OVA)-derived immunodominant octapeptide, HER-2 membrane distal intracellular domain and a C-terminal tag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1692

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       В
                       The Erb-B2 gene is one of the primary genes responsible for the transition of normal breast epithelial cells towards carcinoma in situ and the subsequent development of invasive and metastatic cancer. HPBF (see AAR7703-94), the Erb-B2 promoter binding protein, induces cell division on binding to the promoter. In a method for greater success in early identification and treatment of breast cancer, the initation step for Erb-B2 gene activity is identified. This method involves determining the presence of HPBF in a biopsy from the subject, where the presence of HPBF (relative to its absence in a normal control) indicates the presence of cancer and a decreased chance of long-term survival. Binding of HPBF to the promoter can be inhibited using antisense oligonucleotides or a non-genomic nucleic acid that binds to HPBF; these oligos can be expressed from retro virus or other gene therapy vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1675

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alignment Scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the human HER2 cognate transgene (CTG).

Deletion of amino acids 1-731 of the encoded protein renders the CTG non-transforming. HER2 is a tyrosine kinase-type receptor. This sequence can be used in the cellular immunogen of the invention. The cellular immunogen of the invention. The cellular immunogen of the invention. The cellular cancer, comprises host cells transfected with a construct containing at least one transgene related to the proto-oncogene and driven by a strong promoter. The product of the transgene induces immunoreactivity to host self-determinants on the product of proto-oncogene. The cellular immunogens are used for protective vaccination against cancer (e.g. carcinoma of breast or colon, or various lymphomas) and for immunotherapy of cancer. Use of the immunogen eliminates the need to isolate recognition of a determinant defined by a cancer-specific mutation and generates a systemic (anti-metastatic) response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 56-58; 81pp; English

                                                                                                                                                                                                                           The present sequence represents a cognate transgene (CTG) which is created non-tumourigenic by deletion of amino acids 1-731. The CTG is used in the course of the invention. The specification describes a cellular immunogen for immunizing a host against the effects of the product of a target proto-oncogene which is associated with a malignanacy. The cellular immunogen comprises allogenic cells transfected with transgene construct comprising a transgene cognate to target proto-oncogene and a strong promoter. The cellular immunogen is useful for vaccinating a host against cancer by inserting the transgene construct into the body of the host for the expression of the transgene. The method of the invention is designed to target mutation-driven non-self determinants. The cellular immunogens induce reactivity for self-determinants in the over expressed product of tumour associated and over expressed proto-oncogenes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3919 ACCAGAAGGCCAAGTCCG

Novel synthetic therapeutic compound for inducing immune response and for use in adoptive immunotherapy, has enhanced binding to major histocompatibility molecules and enhanced immunoregulatory properties

Disclosure; Page 57-63; 69pp; English

for inducing an immune response in a subject and for use in adoptive immunotherapy. They are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cancers characterised by expression of the breast cancer antigen, HER-2. Polynucleotides that encode peptides of the invention are useful as hybridisation probes and as primers for the detection of genes of gen transcripts that are expressed in antigen presenting cells (APCs), to confirm transduction of polynucleotides into host cells. The present The invention relates to synthetic theraputic compounds (antigenic peptides) with enhanced binding to major histocompatibility complex (MHC) molecules and enhanced immunoregulatory properties relative to their natural counterparts. Compounds of the invention are useful sequence is human tyrosine kinase-type receptor, genes of gene ls (APCs), to

                                                                                                                                                                                                                                                                                            receptor tyrosine kinase targeted agent for treating tumour by amplifying mRNA from tumour and non-malignant tissues using a primer pair that hybridises to epidermal growth factor receptor (EGER) and/or HER2-neu gene (I), quantitating and obtaining differential expression levels of amplified mRNA and comparing the differential expression levels and threshold levels for expression of (I). The method is useful for assessment of clinical treatment of a patient and as a diagnostic or prognostic tool for a range of cancers including breast, head and neck, lung, oesophageal and colorectal cancer. The present sequence is that of the human HER2-neu DNA sequence used in methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining chemotherapeutic regimen of receptor tyrosine kinase targeted agent for treating tumor by examining EGFR and/or HER2-neu mRNA amount in tumor cells, comparing it to predetermined threshold expression level
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expression level
